## Monthly commentary

**ADRIAN PATURLE**  
Portfolio Manager

**LAURA RAMIREZ**  
Analyste ESG

April 2022 reminded us that one crisis can hide another. The shock of the war in Ukraine is fading, the COVID is resurfacing in China. All this is fostering major disruptions in the flow of raw materials and manufactured goods, fuelling inflationary pressures.

Central banks are still aggressively trying to contain this pressure on prices, with interest rates resuming their upward trend. Over the month, the German 10-year yield went from 0.65% to 0.91% and from 2.35% to 2.90% for its American equivalent. These brutal movements in rates are combined with the end of quantitative easing and the transition to quantitative tightening. Central bankers want to turn off the liquidity tap and no longer be buyer of last resort. Investors expect the ECB deposit rate to be in positive territory by the end of the year.

The Sub-Fin went from 153 to 195 and the vast majority of equity indices ended the month in negative territory. This decline is mainly due to market fears after the publication of economic growth figures for the first quarter of 0% for France and -1.4% year-on-year for the United States for example. In addition, the IMF lowered its global growth forecast for 2022 by -0.8% to +3.6%. But there are still reasons for hope!

These examples do not constitute an investment recommendation

## Our ESG and climate approach

### General methodology

The selection is based on the following ESG tools :

- **Exclusion policy:** determines the exclusions we make due to proven controversies, non-adherence to major initiatives such as the PRB (Principle for Responsible Banking) and sector or thematic restrictions.
- **ACRS - Axiom Climate Readiness Score:** in-house climate rating methodology.
- **ESG Database:** analysis of ESG factors and their rating.

The combination of all these tools allows us to offer a fund with an ESG score higher than that of issuers in the top three quartiles of its investment universe.

### Our climate methodology

The fund is targeting leading issuers in terms of climate change integration. It evaluates issuers based on :

<p><b>Corporate engagement</b></p> <p>Sets the priority level given to climate change by the board and top management, the company's climate strategy, and corresponding objectives, as well as the degree of transparency of communication and the means deployed to address climate change.</p>	<p><b>Climate risk and opportunities</b></p> <p>Assesses the processes and tools used to identify, measure and mitigate the issuer's exposure to climate-related risks, as well as its approach to seizing opportunities arising from the energy transition.</p>	<p><b>Climate contribution</b></p> <p>Assesses the share of the issuer's investments and/or loans in companies or financial instruments that seek to contribute to the "greening" of the economy as well as the products or solutions offered that aim to combat climate change. In the case of banks, Axiom AI is computing an ITR metric (Implied Temperature Rise).</p>

## Glossary

<b>Dette subordination</b>	The general principle is that when there is not enough money to pay all the debts, the subordinated debt will be paid after the other debts.
<b>Tier 1</b>	These securities do not have priority in the event of liquidation, they do not have a maturity date, their coupon is optional and cannot be accumulated. They are the riskiest debt securities and therefore offer some of the highest returns.
<b>Legacy bonds</b>	Hybrid debt that was eligible as regulatory capital under Basel 1 or Basel 2 and that is not eligible under Basel 3.
<b>Contingent convertible (Coco)</b>	Securities that can be converted into shares under certain circumstances, usually when a solvency ratio threshold has been crossed.
<b>ITR (Implied Temperature Raise)</b>	Also known as 2° alignment metric, is a forward-looking measure that attempts to estimate a global temperature associated with the greenhouse gas emissions of entities in a portfolio or investment strategy.
<b>ESG</b>	Refers to the Environmental, Social and Governance (ESG) criteria that enable an analysis of a company's non-financial performance.
<b>Energy transition</b>	Refers to the transition from the current energy production system, mainly based on fossil fuels, to an energy mix based largely on renewable or low carbon energies.

More information on our climate approach is available upon request.

Source : Axiom AI, based on S&P Market Intelligence, Iceberg datalab and our own research | The estimates presented here cannot be compared to other ESG or climate funds because they are based on a proprietary methodology developed by Axiom AI. Our methodology relies on third-party data from ESG/Climate data providers that may contain inaccurate or incomplete data. In the event of insufficient data, these providers may resort to estimates and approximations using internal methodologies that may be subjective. As we rely on this data for our investment decisions, such uncertainty can negatively impact portfolio performance.

## Main risks

**Risk of loss of capital:** the sub-funds do not offer any protection or guarantee. As a result, investors may not be able to fully recover their initial investment.

**Operational risk:** the risk of losses resulting from inadequate or failed internal processes, people, systems or external events. The occurrence of these risks may cause the net asset value of the fund to fall

**Currency risk:** as some of the assets may be denominated in currencies other than the reference currency, the sub-fund may be affected by changes in exchange controls or in the exchange rates between the reference currency and these other currencies. For this reason, the sub-fund will systematically hedge against this risk. However, a residual risk remains. These exchange rate fluctuations may cause the net asset value of the sub-fund to fall.

**Credit risk:** this risk arises from the possibility that an issuer of bonds or debt securities may not be able to honour its payment obligations, i.e. the payment of coupons and/or the repayment of capital at maturity. Such a default may result in a decrease in the net asset value of the sub-fund (including total return swaps or DPSs). This also includes the risk of a downgrade of the issuer's credit rating.

**Counterparty risk:** A sub-fund that invests in OTC derivatives may be exposed to the risk arising from the creditworthiness of its counterparties and their ability to meet the terms of such contracts. The sub-fund may enter into forward contracts, options and swaps, including CDS, or use derivative techniques, which involves the risk that the counterparty may not meet its obligations under each contract.

**Exchange rate:** Any investment in equities may involve directly or indirectly an exchange rate risk. While the net asset value of the sub-fund is calculated in its reference currency, the performance of an underlying asset or its components denominated in a currency other than the reference currency will also depend on the exchange rate of that currency. Similarly, the currency other than the reference currency in which an asset of the sub-fund is denominated implies a currency risk for the sub-fund.

**Liquidity risk:** risk arising from the difficulty or impossibility of selling securities held in the portfolio when necessary and at the price at which the portfolio is valued, due to the limited size of the market or insufficient trading volumes on the market where these securities are usually traded. The realisation of this risk may result in a decrease in the net asset value of the sub-fund.

**Use of derivatives:** If a sub-fund whose performance is linked to an underlying asset frequently invests in derivatives or securities other than the underlying asset, derivative techniques will be used to link the value of the shares to the performance of the underlying asset. While the prudent use of such derivative techniques may be beneficial, derivatives also involve risks which in some cases may be greater than the risks associated with more traditional instruments. Transaction costs may be associated with the use of such derivatives.

**Climate/ESG data risk:** The Management Company's ESG integration process relies on third party data from climate/ESG data providers. Data providers may apply different models and use different sources of information, which may contain inaccurate, incomplete or unaudited data. In addition, where data is insufficient, data providers may use internal methods to produce subjective estimates and approximations. Similarly, the Management Company conducts qualitative analysis based on self-reported information, which is generally not audited by a third party. As the portfolio manager bases its investment decisions on this data, this uncertainty in data collection may have a negative impact on the performance of the portfolio.
